Compare that with this baby 100% stable, no fuss, no muss, after days of stress testing and months of work hauling 1080p video. The myth box is finally, totally rock solid. Cant ask for anything more.Im a computer tech. So I tried everything, I mean everything. RMAd it.Lost a customer over this board!However mine is up and running great, and is rock solid.LAN is kinda fake present but doesnt workcame with the 2004 BIOS. Newer BIOS didnt fix the LAN issue, power connectors are in the middle of the board.Worked great when It worked.Fixed it, works great. Even with low quality ram it works perfectly. If you got a old machine that needs a new board, get this. Also, i didnt test the onboard AC97 Audio. I prefer my SB Audigy 2 ZS. Tyvm. And thank you new eggDClick here for more details. Password Arcade FAQ Community Calendar Todays Posts Search EPoX MotherBoards EPoX Intel and AMD Motherboards.Before that the board was running like a champion. All the hardware, besides the EPoX board I know work as theyre working right now. The new chip was preflashed, so Im wondering if there may be a problem with the bios used. It is the latest. Does anyone know of any problems I have another nforce2 board so I could reflash it. I hope Im just missing something really small here.A while back I had a bad flash on my 8RDA3I, and the chip was kaput. Before that the

board was running like a champion. I hope Im just missing something really small here. It might contain the wrong bios for your

board.<http://thephilippinespages.com/paddyspalmspub/temp/canadian-beef-meat-cuts-manual.xml>

But first, reset the bios using the jumper and boot up with the insert key pressed. If it doesnt work your chip most likely has a bad bios version. Also I was swapping things in and out madly, and forgot to put the speaker in. When I did, it tells me off for not having RAM installed, even though the post code still says F2. So at least it looks like it is picking up the RAM. Doesnt beep with or without a video card though. Ive ordered a PCI video card, partially to see if itll work, and partially because I need one any ways. If I cant boot with it, Ill flash the bios. Maybe you could ask Merlin for a modded one PM him here or ask in HSLAB which is, I think, Polish however you can get an answer in English. As to your issue. Your board should beep without a videocard. If I understand this correctly your board does beep when your memory is not correctly installed I dont usually have the internal speaker wired up cant stand it, so I missed it while I was testing the first time around. Edit Just while I think of it, Ive already tried booting with Insert held down, and it makes no difference. Ive cleared the CMOS countless times and removed the power and battery for 30 minutes 2 or 3 times, but still nothing. Just lookup the order in which the debug LED is showing its codes and see between which procedures it shows F2. I am wondering though.Epox often uses the same PCB for many boards but changes certain chips. With these boards, Epox has used the same PCB layout as all the other pro boards. I first noticed this when I removed the label on the board. Prolly because that one is the most basic. One is a VIA chip and the other is the SI raid chip. Both are missing on the x3I pro. C1 is the memory init. So thats pretty much your problem. Your board might be damaged Im afraid. Epox often uses the same PCB for many boards but changes certain chips. Your board might be damaged Im afraid. I guessed as much about the PCBs.

Would there be any way to check if it is in fact the memory. The reason I ask is because my PCI Post card stops on 54, which is a video init code. I do wonder how the board could be damaged though. Couldnt claim it as insurance, since theres an excess thats worth more then the board. And the board its self is over 2 years old. I really like my board though. Would you like to try it too Please try again later. This article will answer questions regarding how COVID19 might affect you and Corsair. It will crash, usually at start up, sometimes to

the blue screen, other times it will just reboot. Now here is the catch. In trying to figure out this problem I have replaced just about every component except the memory and power supply. When I test the memory sticks by themselves, they appear to test fine. I then switched one stick out and swapped it for a stick of Crucial 256mb pc2100. It still tested fine. So I essentially swapped out both sticks of Corsair and they tested fine when paired with one stick of Crucial, and also individually. What gives Any ideas BTW, I set the volt at default on the RAM at 2.77, to no effect, and then changed it back to the default. Also, during Memtest, the CAS is reported as 2337The bios is the latest and is 6a61bpap. The memory fault that I get is at address 00028a79a28, if that means anything to you. Temps are 37c for the cpu running motherboard monitor. BTW, your link on how to read ram labels didnt work. FYI Please follow the link in my signature I think I have a bad part! and we will be happy to replace them or it. However; if you get errors with both modules, that would suggest some other problem, and I would try testing the memory in another system to be sure.

Please follow the link in my signature I think I have a bad part! and we will be happy to replace them or it. However; if you get errors with both modules, that would suggest some other problem, and I would try testing the memory in another system to be sure. The problem is when they are paired together that I receive the error. When I put two sticks of Crucial in. Unfortunately, I dont have my other system up and running yet, so I cant take these sticks and try them in my other system. As long as both modules are exactly matched. If you want to try replacing them, please follow the link in my signature I think I have a bad part! and we will be happy to replace them or it! Epox ep8k5a2 bios 11202003 date 20120708.
