Not meaning you cant use other brands but briviss networker controller with its fancy functions cant be used on this model so maybe your controller doesnt need to have

those extra wires connected because as you say they may be just dead and not doing anything. The RETURN on the thermostat is the programmed period it is currently running at. The time now is 0846 AM. <http://anthonygillant.com/userfiles/cub-cadet-parts-manual-series-1000.xml>

Appliance Spare Parts Northern Gas and Electric Melbourne. Contact Details 03 9457 2912 178 Holt Parade, Thomastown VIC 3074. Brivis Buffalo 15 Pdf User Manuals. View online or download Brivis Buffalo 15 Installer Manual. Buffalo Gas Ducted Heater. BX3 Gas Heater pdf manual download. Technical Information. Brivis Buffalo 15 Pdf User Manuals. Brivis Service Manual 1.1.1 Brivis Classic CC3 Model Gas Ducted Heater.,. Would you like to try it too Please try again later. It start and stop after couple of minutes and start again. It doesnt maintain heating until preset temperature. Turning the power off and back on. This is the most common reason for it to go out on an overtemp fault. If the fan is not working it does not take the heat off the heat exchanger causing an overtemp fault. Apart from that he doesnt know what else has gone wrong. And will charge me expensive rate per hour for the next visit. That was the first thing the tech replaced but it was not the problem. After much toing and froing with heater specialists one told me that, after you have a duct collapse, it may mean that the wire that measures the heat in the duct has come loose. It comes from the unit, just above the supply vent and then runs along the top of the duct mine is underfloor so it is attached to the bottom of the house and then goes inside the duct at the first bifurcation join. Today its having problems. As I worked today I called the installers from work who advised it may have been a power surge and reset it by turning power off then on. That got it working. Mum turned it on around 8pm and nothing. Anyway I reset it and it started for a few minutes then shut down. I guess it didnt fire up the burner. Something is going on with the circuit board I think. Calling installers on monday who will either come out or get Brivis to come out and have a look. Will keep you posted. Youve saved me a lot of bother.

Ive got a 12 month old Brivis Buffalo B20 which started up and stopped after just one second. Since the heater hadnt been started for a few weeks, I guess that fits with a pilot flame not being able to start. Now its working fine. For the time being. Looking inside, I can see that there is a blue wire with one end connected to gas igniter assembly. The other end has a jumper connector, but it has come off and is hanging free. Given that there are four pins there, I dont know which pins to connect the igniter wire to. Does anyone have any suggestions Thanks. The photo you posted seems to be a different version of the control module than the one I have, even though it has the same model number and similar appearance. Also, the black round thing in the casing, bottom rhs, is absent from mine. Specifically, in my heater, the J6 pins are immediately next to the terminal strip, and are vertically aligned. I checked voltages on my module, and pin 1 shows 6 volts to ground. I dont know if that has any significance in this conversation. Given that, where else would the jumper wire be connected. I cant see any other electrical connections on the ignition system, so I assume this blue wire is the hot wire. Thanks for your help. Pics might help if possible. I just went outside and took another look. Total dumbass. I didnt see the internal details of it before because I was looking at in bright daylight, and the sun was right in my eyes. Hows that for an excuse Since it is midnight now, I will leave it for tomorrow, and double check before I do anything. I assume that if I plug the hotwire into this, it should solve the problem. I will report back tomorrow. Thanks everybody for the help so far. Man! Mucho embarrassment! Then when I looked inside, its a miracle. I could see everything. In the contrast between the bright sunlight and the shadow inside the unit, without the shade cloth, both were invisible. So I connected the hot wire, and now all is working fine.

<http://schlammatlas.de/en/node/17671>

Just in time for the heatwave. Now all I am wondering how the wire disconnected in the first place. Aliens The moral of this story is not to attempt repairs unless you are sure that you can see everything clearly. Thanks to all who offered their suggestions. The unit sometimes starts up ok but cuts out after 510 minutes and doesnt get to temperature. If I switch off the power at the outside

furnace for a minute then switch it back on it will generally fire up and run again before cutting out again a short time later. Occasionally I get code 4, rollout lockout. I thought it was the thermostat so I did the obvious checks like removing the thermostat panel, cleaning the contacts and replacing the batteries. This still didn't fix the problem. Then I read that when it's supposed to run but doesn't and you bridge W and R terminals at the outside unit then if it starts ok it's likely a faulty thermostat. I did this test but it still wouldn't run. Knowing that the fan was running ok, all I could think why it's overheating is an obstruction in the return air duct because I recently did a lot of renovations and the plumber was poking around under the house a lot. So I went under the house and found a few problems with my ducting. To start with, a duct had fallen off at a 3 way junction and this explains why I wasn't getting heat to the far end of the house. But secondary and more importantly I found the inlet air duct had collapsed to flat oval shape and looked almost flat. This would make it hard for the heater to suck air from inside the house and might explain the overheat issue. I squished the ducting round again and added a couple more suspenders. If you're having a similar error, do yourself a favour and check these things before calling a serviceman out. During the installation of the replacement unit, he found the inlet duct near the unit was collapsed and subsequently unblocked it. The newly replaced unit stopped working 2 days after the installation and called me for help.

<http://energysatrap.com/images/commercial-manual-floor-sweeper.pdf>

I then followed the wires and found the faulty temp sensor on the bottom of the Main Fan there is another sensor on the top in series to the one on the bottom. I then gave it a wack and it seems fixed the issue. After firing up the unit, it cuts out the gas around every 5 minutes due to overheating and fires up again after 1 minute or so after cooled down below the sensors threshold with hysteresis function, I hope. The issue persisted even after the replacement of the bottom sensor with a same type from the original unit. I even checked the return duct in the house, which seems having enough suction. If not, what might be the causes for this symptom. Refurbished honeywell rth2510 thermostat in excellent condition. Manual install manual Suits most gas ducted heater. The Brivis Networker NC6 Manual The Brivis Networker Controller can operate in either auto or manual modes. In manual mode, you set your own temperature, then leave the rest to the Networker. It will maintain the temperature you have chosen, until you choose to turn it off. The Braemar Rebuff is built to be able to replace the Brivis buffalo Heater, Suitable to sit right on top of the existing base box minimizing the cost in installation when converting over to a Braemar Gas ducted heater. Ducted joiners also included. This unit replaced our old Brivis Buffalo, which worked well for just over 20 years. Brivis sent a technician who replaced the controller, but the issue continued. On occasions the heater would not turn off, so had to be reset again. Last time, it switched itself off and I had to reset it numerous times to get it started again. Just recently, a technician visited again and replaced some. Read more parts. We're now hoping this will resolve the issue. Rinnai has been very good in the way it has addressed our concerns, and the technician they sent Greg was excellent.

Write a review on ProductReview.com.au ! David Gippsland, VIC Air wasn't as hot as the Buffalo 20 when the heater was first installed, but being an engineer I know that the more airflow passed over the heat exchanger the more heat is pulled off it. This extra air spreads the energy taken from the heat

exchanger further therefore resulting on colder air, however you still have more energy being delivered to your house, its actually pretty simple. People clearly just like to complain. If they. Read more bother to look in the manual for the heater you can easily adjust the duct temperature, which I did. Also Upgraded my controller to the one with the dial so I can program it to come on and off and change to different temperatures at different times of the day and days of the week. I think it is brilliant and wouldnt hesitate to buy another one!! One down side is that it is a bit rattly, if you have the choice install it near your laundry or bathroom or toilet, not you bedroom. I used that foam tape you can get from Bunnings to put between the lid and outer body, that quietened it down significantly. Purchased in May 2019. As a result the heater didnt work and we had no heat over Easter and for the three weeks it took to get a service person to attend. The service technician found that the fault was due to a faulty PCB or Motherboard. Thankfully it was under warranty otherwise it would have been very expensive. I had a Brivis Buffalo which worked flawlessly for over 20 years this one fa. I have tried for over two weeks to get a response via email without any success. Called their Customer Service number today, after waiting finally spoke with an unhelpful, uncaring person who referred me to email another department. He said everything is fine, didnt check the heater at all just said everything works fine and I need to get the heater upgraded for stronger one when this one was recommended for my single story house. After a week called up a private heater specialist. He opened the heater up and he found unit to have factory faulty supply air sensor He told me he used to work for Brivis for 30 years but they suck. Read more ed every worker and got cheap Chinese people to save money that have no clue what they are doing. Avoid the headache, customer service is a pain in the posterior and you wont get a refund even if its under warranty. Date Purchased Jul 2016 2 likes Share More Similar opinion. Write a review on ProductReview.com.au ! Reg It was a very reliable appliance. When it was no longer serviceable I had it changed over to a BX520. It works well just like the old one. When I get services from the company the service guys are all experienced and of course they know all the error codes. What some people dont tell you is that they just put in a replacement heater as cheap as they can and then the wife asks for a few more ducts, so they put them in too. They dont care when the technical guy tells them it will be undersi. Read more zed they just put them in. Im OK because Im a technical guy, but some people have no idea, choose the cheapest solutions and then go crook because its not sized right. review on ProductReview.com.au ! Dane This heater is hopeless. Cannot get it up to 21 degrees in winter. May be claimed to be more energy efficient per hour but it has to run much, much longer to increase the temperature by each degree, consequently much more costly to run. The installer came back and checked the temperature settings and fan speed which were both OK. Now stuck with this model which hopefully will fail within the warranty period.

Be warned do not buy a Brivis BX520 Date Purchased Jul 2016 3 likes Share More Similar opinion. Write a review on ProductReview.com.au ! Martin C We cant get it up to 20 degrees on a cold day and we get constant error messages which require us to reset. Customer service cant even tell us what the error code means. This is the 4th callout in 6 weeks and we are asked to wait a week. The next call will be to consumer affairs. Do not buy a Brivis !!!! 3 likes Share More Similar opinion. Depends on its condition. Like Report Rinnai A. Brivis 1 week ago Hi Mike, Thanks for the question. The Brivis Buffalo BX520 cannot be spilt, the product is an external heating unit. Please contact our technical helpdesk for further information on 1300 555 545 option 3. Thanks, Rinnai Australia. Like Report Michael asked 3 months ago Buffalo BX520 Hi just had a bx 520 installed. It takes over 2 hours just to warm my house from 17 degrees to 20 degrees. The house is a small 3 bedroom house. I don't understand why it takes so long is there wrong with the heater.

Thanks Michael Like Share More 6 answers David 3 months ago Good morning Michael, Have a look at the manual that came with the heater, it shows you how to increase the air temperature and the airflow if you have the networker controller the one which has a dial which can turn. If you only have a simple controller, get the installers back who will have one and they can increase the temperature and airflow for you. Most installers are really lazy and cant be bothered to setup the heater for each house they install a heater into. David Like Report Michael 3 months ago Hi David I do have a network controller and iv looked at the manual but cant see where i can increase the air temperature. Please help. Michael Like Report Rinnai A. Brivis 3 months ago Hi Michael, Thank you for the question. We would recommend speaking with our Technical Helpdesk, who can be reached on 1300 555 545 option 3 for assistance and troubleshooting. Thanks Rinnai Australia Like Report View 3 more answers Rose L. asked 4 months ago Buffalo BX520 My newly installed bricks buffalo bx520 just did not start this year even tried so many times on and off power and gas switches, has electricity and gas but just no air come in, the heater did not run at all, not sure what was the issue. It was installed 2018 Like Share More 5 answers David 4 months ago There are little LED's that flash on the control board. These should flash a certain number of times and then pause and repeat. That number of flashes gives you an indication of what is wrong. If there are no LED's lit up, the fuse may have blown. Check the users manual for fault codes, it could be many different issues. Like Report Rose L. 3 months ago Hello David, thank you for your replying to my question. My wall controller is a very basic one, it does not have any error number come on the screen at all, I know there is one controller which will indicate error code, I wish I had those ones.

I booked for Brivis service on line, hope they will contact me soon before another cold front come. Thank you for your reply, David. Like Report David 3 months ago That's ok Rose. My apologies for not being so clear. There is a control board inside the heater itself. There will be some holes

moulded into the cover, in one of those you will be able to view the flashing LED. I hope this helps, I also hope Brivis can come soon.this is the busy time of year when everyone turns their heaters on for the first time in 6 months and find the issues that grew over summer. Once I saw that ants had made their nest in a heater and the owner had decided to kill them with fly spray, unfortunately the owner sprayed directly onto the circuit board before Brivis had a cover on it and short circuited everything. You can never tell what might be the issue after the heater has been sitting dormant for 6 months.
