

## PROTECTION OF EYES FROM LASER BEAM DURING SERVICING

This set emits laser. Therefore, be sure to follow carefully the instructions below when servicing.

**WARNING!**  
WHEN SERVICING, DO NOT APPROACH THE LASER EYE WITH THE EYE TOO CLOSELY. IN CASE IT IS NECESSARY TO CONFIRM LASER BEAM EMISSION, BE SURE TO OBSERVE FROM A DISTANCE OF MORE THAN 30cm FROM THE SURFACE OF THE OBJECTIVE LENS ON THE OPTICAL PICK-UP BLOCK.

- Caution: Inhibit laser radiation when open and interlocks disabled and avoid exposure to beam.
- Avoid use of opening laser during use of function. Avoid use of laser for other than intended use.

**VAROITUS!**  
Laitteen Käytännön muuta kuin läsnä käyttöön jättäessä muuttamalla tavalla saattaa aiheuttaa käyttäjän turvallisuusturvakokoon 30 cm:n näkömäärämittäille laser säteilyä.

**VAROITUS!**  
On apparatin används på annat sätt än vad som specificeras i denna bruksanvisning, kan användaren utsättas för oavsiktlig laserstrålning, som överstiger gränsen för laserklass 1.

**CAUTION**  
Use of controls or adjustments or performance of procedures other than those specified herein may result in hazardous radiation exposure.

**ATTENTION**  
L'utilisation de commandes, réglages ou procédures autres que ceux spécifiés peut entraîner une dangereuse exposition aux radiations.

**ADVÄRSEL**  
Öppningsställning vid åbning när sikkerhedsafbrydere er i funktion. Undgå udsættelse for stråling.

This Compact Disc player is classified as a CLASS 1 LASER product.  
The CLASS 1 LASER PRODUCT label is located on the rear exterior.

## Precaution to replace Optical block

(KSS-213B)

Body or diode electrical potential could kill laser diode in the optical block. Be sure ground body and workbench, and use the diodes do not touch the diode.

1) After the connection, remove solder shown in right figure.

**Speed adjustment.** (See Fig. 15).

Strobe dots are set on the rim of the turntable platter according to the power frequency and the number of revolutions of the records. Make adjustment, referring to strobe dot indication.

Set the speed selector to the number of revolutions to be adjusted.

Release the arm clamp and raise the cueing lever. Move the tonearm to a slight extent towards the turntable platter. The strobe illuminator/pilot lamp will illuminate the strobe dots, and the turntable platter will rotate.

While turning the pitch control knobs either to "+" side or "-" side, adjust to such an extent that the strobe dots of the turntable platter look as if they were stationary. The state under which the strobe dots seem to be stationary represents the correct speed.

**"+" direction**

This increases the speed of the turntable rotation, and the strobe dot pattern seems to flow in the same direction as the turntable platter.

**"-" direction**

This decreases the speed of the turntable rotation, resulting in a state opposite to that in the "+" direction.

**Note:**

**Strobe dot pattern**

The strobe illuminator/pilot lamp of this unit employs the commercially available power source. The frequency of such power source, when actually measured, has a fluctuation of about 0.2%. As such a fluctuation of the power source affects the strobe illuminator, the strobe dot pattern also seems to fluctuate to a certain extent. But the unit is not affected by the fluctuations of the power source, since a D.C. motor is employed.

**Operation principles of the SL-1900**

This unit, like the SL 1300 has a rational motor structure, and its drive control circuit is the B.F.G. type (Black TECHNICAL EXPLANATION electromagnetic force frequency generator) which is constructed on a single integrated circuit (IC) chip (IAN630). The following is a block diagram of the IC (IAN630) for which the operating principle will be briefly explained.

**Operating principle**

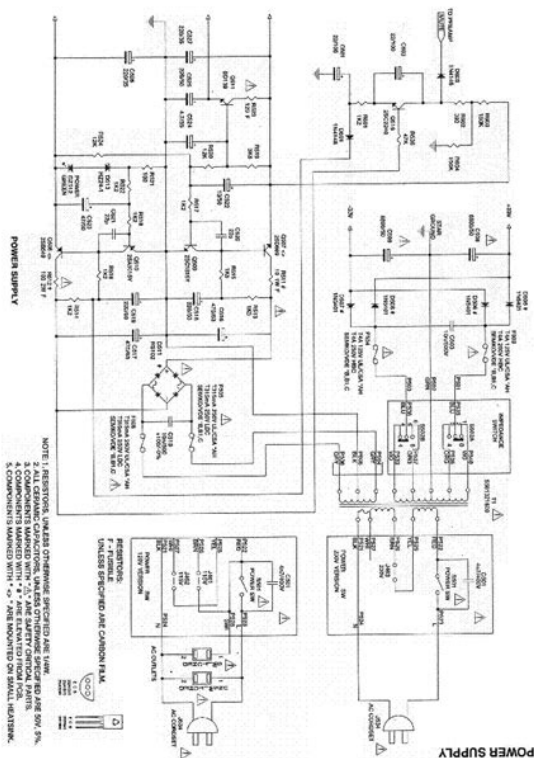

The back electromotive force, which is generated by the drive coil winding according to the rotation of the motor, is detected and converted to a frequency signal that is proportional to the number of revolutions. Conversion is performed by a wave-shaping circuit and a logic circuit. (This is referred to as the B.F.G. method). This frequency signal is compared with a standard signal by means of a frequency-voltage conversion circuit which converts it to a voltage signal in order to maintain a constant number of revolutions. After removing unnecessary

frequency components, with the operational-amplifier active filter, from this voltage signal, it controls the current flow in three differential switching circuits. As a result, the flow of current in the drive coil winding is always constant maintaining the correct rotational speed. Control of the rotational speed can be performed by means of adjusting the standard signal generator circuit according to the rotational speed adjustment circuit.
