No matter what the application, the CR1 604 VLZ can be configured for optimal use. Placed in a rack system, the CR1 604 VLZ can be set so that jacks are facing front or facing the rear, keeping wandering hands from playing with cords. Whether used in a permanent installation, or as a portable mixer, the CR1 604 VLZ is completely at home. Durable and reliable. Built like a tank, the CR1 604 VLZ is a team player that can stand up to vigorous use, day in and day out, any place it is installed. Its sturdy yet light steel monocoque construction houses rugged, double-sided through-hole plated fiberglass circuit boards, and 60mm faders with ultratight lip seals for keeping out dust and other contaminants. They're designed to last, too, thanks to co-molded potentiometers that don't get brittle and crack up. If you are here, it was rather the case. However, you are not the only person having problems with keeping the operation manual of all household devices. Below are few guidelines regarding how and why you should collect the product manuals. However, we believe that the manuals should include the most important and needed information about Mackie CR1604VLZ, not to discourage the user to read. Obviously, if a device Mackie CR1604VLZ has multiple advanced functions, we will not avoid a high amount of information in this document. Then, it will be much easier to find it than look through the purchase boxes which have already been thrown away by you or any other of household members. It will be enough to clear the drawer once in a year and throw away any manuals of the devices you do not use anymore. Thus, you can avoid storing any unnecessary documents and keep only those which are valid. You can also download and print the manual Mackie CR1604VLZ to place it in your drawer. Its unique rotating input pod makes this possible. Built-in double busing is nothing more than Y cords living inside the mixer instead of hanging out the back.

The INSERT point is after the mix amps, but before the MAIN LR MIX fader. You can leave this switch on all the time; the CR1604VLZ is conservatively designed, so heat buildup isn't a problem even in 24-hour a day operation. It is possible for airborne crud to land on the track. We have found that on most "stereo" reverbs, the second input just ties up an extra aux send and adds nothing to the sound. Deceptively simple, considering the multitude of signals that can be monitored by it. The signal remains postlow cut, pre-mute and pre-fader. These modification instructions are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than changing the fuse unless you are qualified to do so. Frequency is measured in units called Hertz Hz. One Hertz is one repetition or cycle per second. See channel strip. A knee is a sharp bend in an EQ response curve not unlike the sharp bend in your leg. In most cases, the balanced ground earth will also be connected to the ground earth at the unbalanced input. You can make "Y"s and multi for the outputs of both unbalanced and balanced circuits. The obvious external power source for any modern microphone is a battery. The audio travels via pins 2 and 3, the power travels between pins 2 and 3 simultaneously, and pin 1 is the ground for both audio and power. Search Results. Looking for mackie 908 Records Found. Repair guide for Mackie Mixer CR1604 Service Manual. Anyone got a schematic Anyone got a schematic The Solos dont mute the other channels, theres no lefthandside from either the main outs or the ctrl rm outs or present on the main level indicator lights, solos dont do anything when using the main outs, and when on ctrl rm outs, the LHS works when on PFL but not AFL. still no muting of other channels when a channel is soloed, but level indicator lights work too in this mode. Ive got a feeling that theres 2 main problems the left pan assign controller and the solo controllers. Im going to start by cleaning them up with some switch cleaner and get a DMM across them to see whats going on, but I dont have a schematic unfortunately so it could be a slow process.

Ive got the user manual etc from the Mackie Website, but theres no schematic with it, just a block signal flow diagram. Does anyone have a wiring diagram for this mixer. Heres hoping, Phil Compooter man, electronics noob. Anyone got a schematic Anyone got a schematic I could email those pdfs to you.guinness Anyone got a schematic Does anyone happen to know the difference between the CR1604VLZ and the VR1604VLZ. This schematics for the VR whereas the one I have on my desk is a CR. Thanks again for your help, Phil Compooter man, electronics noob. Anyone got a schematic I have never heard of a VR1604 it could be an export model number but have seen plenty of CR1604s in fact I have one about a foot from my right elbow here in my studio. I have called

Mackie Support several times and have always been treated very well and not because I was an Authorized SC for them. For all they knew, I could've been Joe Schmoe off the street. If you explain that you are a tech, my experience has been that they will help you as much as they can over the phone, within reason. Good Luck and let me know if you still need a schematic. TP Anyone got a schematic I have a 1604vlz after being turned on for a few minutes, all the solo lights trigger and a deafening sawtoothlike oscillation is emitted from the master outs. I noticed a chap at another forum had an identical fault on his, but he couldn't tell me what it was as Mackie fixed it for him. Thanks, Justin Anyone got a schematic Compooter man, electronics noob. Anyone got a schematic Anyone got a schematic All that to say that I have never heard of the problem you are having but most power supply problems are traced back to faulty solder joint connections. Good Luck. TP Anyone got a schematic I've had my head inside this thing most of the day now, and I think I'm cutting down the possibilities, but then again, I still feel way short of a conclusion. Here's my symptoms 1.

Channels 1,2,7,8,9,10,13,14,15,16 no left channel in normal mode and PFL mode, works fine in AFLSIP mode. Also possibly of note tape input works fine both sides. The more I'm probing about this thing, the more problems I'm finding. I've not even started with a DMM yet and I'm tearing my hair out already. Damn, why can't our clients just use our SSLs and be happy! Phil Compooter man, electronics noob. Anyone got a schematic Anyone got a schematic Anyone got a schematic Compooter man, electronics noob. Anyone got a schematic Did you make any headway on it. Just curious, Test Point Anyone got a schematic I'm going to bang a sin wave through it from a sig gen and scope it to see if I can locate the point that those 6 channels get distorted. If no luck after that I'll start testing the caps etc. Incidentally, if anyone's come across problems like these before I'd certainly appreciate any advice. Phil Compooter man, electronics noob. Anyone got a schematic For the price of a VLZpro, you could probably have at least 5 hours in Studio 3. Phil Compooter man, electronics noob. Anyone got a schematic I traced a sin wave all the way from pan pot to output and it turned out that the left channel wasn't missing until the main fader. I took the main fader apart and it was completely gunked up. The brushes on the vca were dragging some dirt/fluff up and down the tracks with it. Bit of isopropanol and a baby bud and all's well with the left channel now. Now I've just got those 6 distorting channels and the solo problem. The studios quiet today so I'm going to have a crack at it a bit later. Phil Compooter man, electronics noob. Anyone got a schematic I know it's been a few years Anyone got a schematic. To start viewing messages, Nothing is working Any ideas please Some folks there could help. Is the RUDE SOLO led doing anything, on or off. Some folks there could help.

There appears to be OPamps that control the SOLO leds, either sensing input and flickering or full on when SOLO is selected on a channel. It could be as simple as a loose plug on the header. Not sure what your skill level is for working on something like this and a few images I found of a 1604 disassembled didn't look too friendly for opening it up to access things. If you can get at the plug P1, perhaps removing it and reseating it may help with some luck, otherwise checking various points with a meter for the 16 vdc supply voltage may be the next step. Below is an image I denoted the plug P1 on the Main board. To answer your question, my willingness to give things a go far exceeds my skill level in this area Preliminary results. The voltages on P1 are as follows 7 31V 6 16V 4 31V 3 16V 1 31V I was liking the first ones better although those seemed messed up Black meter lead in the Neg jack on the meter and to a Ground point in the mixer, right. There is a P1 on the power supply module which is AC voltage from the transformer. It's the P1 on the Main circuit board is where you should be measuring I partially assembled it for a retest and the only life is still in the unanimous enthusiasm of the solo LEDs. Still no power on light or other lifeform. After a few minutes, a

capacitor in the power supply area went off with an impressive plume of smoke. Ive purchased a replacement but havent got to that repair yet. So its been some fun so far. Im not angsting, but enjoying the process. With the capacitor replaced, I guess Ill be looking for the next thing to check. cheersWith the mic, though, Im getting a very faint signal. Coorganizers can edit group and event pages, access sales and attendee information, manage ticket sales and more. These can fail and operate more like switches rather than faders. Without witnessing the behavior, I can not state that for sure. While these mixers are not the hardest to work on, they are time consuming. The faders can be purchased from Mackie directly. If you need to have this repaired, any shop that repairs audio gear should be able to repair this for you. Where are you located Dan If there is a high signal level on one bus, you could be getting some crosstalk from that channel onto the channel with the higher gain setting. Try to track this down a bit by experimentation. For example, do you hear this with NO connections at all, but with the gain turned up on one channel. Please try a few things to narrow this down a bit and Ill try to provide you with some options. Thanks, Dan Login to post Fixya is unable to identify a source for the motherboard other than Yamaha.
